

## Pseudo Elements

Allow you to create items that do not normally exist within the structure of your website.  
They are added to selector (elements, classes or IDs)

```
ie: p::after { content: ">"; }
```

**content:**

- CSS property used by ::after or ::before;

- Adds content to the element

  - "actually text that is between quotes"

  - URL(url or image)

  - none

- Not available to screen readers

- Should only be used to display non vital information

**::after**

- Insert something after the content of your element

**::before**

- Insert something before the content of your element

**::first-letter**

- Affects the first letter of specified selector

- Only works on block elements

**::first-line**

- Affects the first line of the specified selected

- Only works on block elements

- First line is determined by the browser width

**::selection**

- Affects the content that is selected by the user

- Only properties that can be modified are: color, background, cursor, and outline
